Computer Coding Review

1 Practice problems

This assignment's focus is to get you to practice using a computer to help solve mathematical problems. Please submit a printout that includes all relevant computer code. This question asks you to simulate the growth of a single population with an Allee effect. The population has n individuals at time t, and its' growth is governed by the following equation:

$$\frac{dN}{dt} = f(n) = rn(1 - \frac{n}{k})(\frac{n}{a} - 1) \tag{1}$$

- a Assign values 1, 10, and 100 to variables r, a, and k respectively (i.e. r = 1, a = 10, k = 100).
- b Define the function, f(n), for the growth rate of the population, with n (the population size) as an input. Evaluate this function at n = 20.
- c Plot f(n) with n values ranging from 0 to 110.
- d Define a new function, f(n, r, a, k) with 4 inputs, and plot f(n, 1, 25, 100) with n values ranging from 0 to 110.
- e Simulate the growth of a population over 100 years, with 15 individuals to begin with (i.e. at $n_0 = 15$), and r = 1, a = 10, and k = 100. Plot the resulting population vs. time dynamics.
- f Repeat this procedure with 5 individuals to start with (i.e. n[0]=5).
- g Create a function with inputs r, a, k, and n_0 that simulates this the growth of the population over 100 years and prints a graph of the population trajectory.

Answers For each of these questions, example code is included below for completing the tasks in Mathematica, R, and Maxima.

a Mathematica code:

```
r = 1; a = 10; k = 100;
```

R code:

```
r = 1; a = 10; k = 100;
```

Maxima code:

```
r: 1; a: 10; k: 100;
```

b Mathematica code:

R code:

Maxima code:

```
F(n) := 1*n*(1 - n/100)*(n/10 - 1);
F(20);
```

c Mathematica code:

```
Plot[F[n], {n, 0, 110}]
```

R code:

```
x<-seq(0, 110, length=100)
plot(x, F(x), type="l")
```

Maxima code:

```
plot2d (F(n), [n, 0, 110]);
```

Note, if you are using wxMaxima, then you need to use the command "wxplot2d"

d Mathematica code:

R code:

Maxima code:

e Mathematica code:

R code:

```
require(deSolve)
odefun<-function(time, state, pars) {
   return(list(F(state, r=1, a=10, k=100)))
}
out<-ode(y = 15, times = seq(0, 100, length=100),
   func = odefun)
plot(out[,1], out[,2], type="l", xlab="time", ylab="n")</pre>
```

Note - if you do not already have "deSolve" installed, you will need to run the command: <code>install.packages("deSolve")</code> before you can do anything else.

Maxima code:

```
plotdf(F(n, 1, 10, 100), [t, n], [trajectory_at, 0, 15], [direction, forward], [t, 0, 100], [n, 0, 100]);
```

f Mathematica code:

```
 \begin{array}{l} s = \text{NDSolve}[\{y\,'[\,x] == F[\,y[\,x]\,,\ 1,\ 10,\ 100]\,,\ y[\,0] == 5\}\,,\\ y,\ \{x,\ 0,\ 100\}] \\ \textbf{Evaluate}[\,y[\,1]\ /.\ s\,] \\ \textbf{Plot}[\,\textbf{Evaluate}[\,y[\,x]\ /.\ s\,]\,,\ \{x,\ 0,\ 100\}\,,\ \textbf{PlotRange} \rightarrow \textbf{All}\,] \\ \end{array}
```

R code:

```
odefun<-function(time, state, pars) {
  return(list(F(state, r=1, a=10, k=100)))
}
out<-ode(y = 5, times = seq(0, 100, length=100),
  func = odefun)
plot(out[,1], out[,2], type="1", xlab="time", ylab="n")</pre>
```

Maxima code:

g Mathematica code:

```
\begin{array}{l} plotF = \textbf{Function}[\{n0, \ r , \ a , \ k\}, \ s = \textbf{NDSolve}[\{y'[x] = F[y[x], \ r , \ a , \ k], \\ y[0] = n0\}, y, \ \{x, \ 0, \ 100\}]; \\ \textbf{Plot}[\textbf{Evaluate}[y[x] \ /. \ s], \ \{x, \ 0, \ 100\}, \ \textbf{PlotRange} \rightarrow \textbf{All}]] \end{array}
```

R code:

```
pltfun<-function(n0, r, a, k) {
  odefun<-function(time, state, pars) {
    return(list(F(state, r=pars[1], a=pars[2], k=pars[3])))
  }
  out<-ode(y = n0, times = seq(0, 100, length=100),
    func = odefun, parms=c(r, a, k))
  plot(out[,1], out[,2], type="l", xlab="time", ylab="n")
}</pre>
```

Maxima code:

```
plotF(n0, r, a, k):=plotdf(F(n, r, a, k), [t, n],
  [trajectory_at, 0, n0], [direction, forward],
  [t, 0, 100], [n, 0, k]);
```
